

# 1. Smart Attendance checker

Java Code

```
import java.util.Scanner;
```

```
public class Main {
```

```
    public static void main (String[] args) {
```

```
        Scanner input = new Scanner (System.in);  
        System.out.print ("Enter per of your attendance:");
```

```
        int n = input.nextInt();
```

```
        if (n >= 75) {
```

```
            System.out.println ("Eligible for exam");  
        }
```

```
    } else {
```

```
        System.out.println ("Not Eligible for Exam");  
    }
```

```
}
```

```
}
```

Output

Enter your percentage of your Attendance : 75  
Eligible for Exam.

## 2. Age Predictor:-

```
import java.util.Scanner;  
import java.time.Year;
```

```
public class project 2 {
```

```
    public static void main (String [] args) {
```

```
        Scanner input = new Scanner (System.in);  
        System.out.println ("Enter your current age : ");  
        int age = input.nextInt();
```

```
        int a = age + 10;
```

```
        int b = age + 25;
```

```
        int c = age + 50;
```

```
        System.out.println ("Your age after 10 years is " + a);  
        System.out.println ("Your age after 25 years is " + b);  
        System.out.println ("Your age after 50 years is " + c);
```

```
        int year = Year.now().getValue();
```

```
        int d = year - age;
```

```
        int e = d + 100;
```

```
        System.out.println ("In " + e + "AD your age will be  
        100 years. ");
```

```
    }
```

```
}
```

Output

Enter your current age : 79

Your age after 10 years is 89.

Your age after 25 years is 104.  
Your age after 50 years is 129.  
In 2019 your age will be 100 years.

### 3. Fitness challenge tracker.

```
import java.util.Scanner;
```

```
public class Project3 {  
    public static void main (String[] args) {  
        Scanner input = new Scanner (System.in);  
        int totalStep = 0;  
        int highestStep = 0;
```

```
        for (int i = 1; i < 7; i++) {  
            System.out.print ("Enter your steps in Day "+ i + ": ");  
            int currentStep = input.nextInt();  
            totalStep += currentStep;
```

```
            if (currentStep > highestStep) {  
                highestStep = currentStep;  
            }  
        }
```

```
        int averageStep = totalStep / 7;
```

```
        System.out.println ("Total step you travelled: " + totalStep);  
        System.out.println ("The average of your age is " + averageStep);  
        System.out.println ("The highest step you travelled: " + highestStep);  
    }  
}
```

Output:-

Enter your step in Day 1 = 1756  
Enter your step in Day 2 = 9087  
Enter your step in Day 3 = 6675  
Enter your step in Day 4 = 4567  
Enter your step in Day 5 = 9987  
Enter your step in Day 6 = 9999  
Enter your step in Day 7 = 6679

Total step you travelled : 53750

The average of your step : 7679

The highest you travelled : 9999.

#### 4. Fibonacci Series.

```
import java.util.Scanner;
```

```
public class project 3
```

```
public static void main (String[] args) {
```

```
Scanner input = new Scanner (System.in);
```

```
System.out.print ("Enter term: ");
```

```
int term = input.nextInt();
```

```
int a = 0, b = 1;
```

```
for (int i = 0; i < term; i++)
```

```
{
```

```
System.out.print (a + " ");
```

```
int next = a + b;
```

```
a = b;
```

```
b = next;
```

```
}
```

```
}
```

Output:

Enter term: 7

0 1 1 2 3 5 8

5. Prime number check

```
import java.util.Scanner;
```

```
public class project5
```

```
{
    public static void main (String [] args) {
```

```
        Scanner sc = new Scanner (System.in);
```

```
        System.out.print ("Enter a number: ");
```

```
        int num = sc.nextInt ();
```

```
        boolean isPrime = true;
```

```
        if (num <= 1) {
```

```
            isPrime = false;
```

```
        } else {
```

```
            for (int i = 2; i <= num / 2; i++) {
```

```
                if (num % i == 0) {
```

```
                    isPrime = false;
```

```
                    break;
```

```
            }
```

```
        }
```

```
    }
```

```

    if (isPrime) {
        System.out.print(num + " is a prime Number.");
    } else {
        System.out.print(num + " is not a prime Number.");
    }
}
}

```

Output :

Enter a number : 7  
7 is a prime number.

6. logical Operator Check.

```

import java.util.Scanner;

```

```

public class project 6 {
    public static void main (String [] args) {
        Scanner input = new Scanner (System.in);
    }
}

```

```

        System.out.print("Enter first number: ");
        int a = input.nextInt();
        System.out.print("Enter second number: ");
        int b = input.nextInt();
        System.out.print("Enter third number: ");
        int c = input.nextInt();
    }
}

```

```

    if (a < c && b < c) {

```

```

        if (a + b == c) {

```

```

            System.out.println("1st and 2nd number is  
the sum of 1st and 2nd number.");
        }
    }
}

```

```

    } else {

```

```
System.out.println("No third number is not the sum of  
1st and 2nd number.");
```

```
}
```

```
{
```

```
else {
```

```
System.out.println("Your entered number is not less than  
third number.");
```

```
}
```

```
}
```

```
}
```

Output:

Enter first number : 7

Enter second number : 6

Enter third number : 13

Yes third number is the sum of first and second numbers.

## 7. Multiplication table.

```
import java.util.Scanner;
```

```
public class project 7 {
```

```
    public static void main (String [] args) {
```

```
        Scanner input = new Scanner (System.in);
```

```
        System.out.print("Enter a number: ");
```

```
        int num = input.nextInt();
```

```
        System.out.println("The multiple of " + num + " is");
```

```
        for (int i = 1; i <= 10; i++) {
```

```
            int sum = num * i;
```

```

    }
    }
    }
    System.out.println (num + "x" + i + "is" + sum);
    }
    }
    }

```

Output:

Enter a number : 8

The multiple of 8 is

8 x 1 is 8

8 x 2 is 16

8 x 3 is 24

8 x 4 is 32

8 x 5 is 40

8 x 6 is 48

8 x 7 is 56

8 x 8 is 64

8 x 9 is 72

8 x 10 is 80.

## 8. Right angled triangle Pattern

```
public class project8 {  
    public static void main (String[] args) {  
        int num = 5;  
        for (int i = 1; i <= 5; i++) {  
            for (int j = 1; j <= i; j++) {  
                System.out.print ("* ");  
                System.out.println ();  
            }  
            System.out.println ();  
        }  
    }  
}
```

Output

```
*  
* *  
* * *  
* * * *  
* * * * *
```

## 8. Pyramid Pattern

```
public class project9 {
    public static void main (String[] args) {
        int a = 5;
```

```
        for (int i = 1; i <= a; i++) {
            for (int j = 1; j <= a - i; j++) {
                System.out.print(" ");
            }
            for (int k = 1; k <= (2 * i - 1); k++) {
                System.out.print("* ");
            }
            System.out.print("\n");
        }
```

```
}
```

Output:

```

      *
    * * *
  * * * * *
* * * * * *
* * * * * * *

```

## 10.0 Palindrome Number.

```
import java.util.Scanner;
```

```
public class perfect1003
```

```
{
    public static void main (String [] args) {
```

```
        Scanner input = new Scanner (System.in);
```

```
        System.out.print ("Enter a word: ");
```

```
        String word = input.nextLine();
```

```
        String reverse = new StringBuffer(word).reverse().toString();
```

```
        word = word.toLowerCase();
```

```
        reverse = reverse.toLowerCase();
```

```
        if (word.equals(reverse)) {
```

```
            System.out.println ("The word is palindrome.");
```

```
        } else {
```

```
            System.out.println ("The word is not palindrome.");
```

```
        }
```

```
    }
```

```
}
```

Output

Enter a word: ~~test~~ to t

The word is palindrome.

## 11. Basic Calculator;

```
import java.util.Scanner;
```

```
public class project11 {
```

```
    public static void main (String[] args) {
```

```
        Scanner input = new Scanner (System.in);
```

```
        System.out.print ("Enter first number: ");  
        double a = input.next Double();
```

```
        System.out.print ("Enter operator: ");  
        char operator = input.next().charAt(0);
```

```
        System.out.print ("Enter second number: ");  
        double b = input.next Double();
```

```
        switch (operator) {
```

```
            case '+' :
```

```
                System.out.println (a+b);  
                break;
```

```
            case '-' :
```

```
                System.out.println (a-b);  
                break;
```

```
            case '*' :
```

```
                System.out.println (a*b);  
                break;
```

case '/' :

System.out.println(a/b);  
break;

}

}

{

Output

Enter first number : 7

Enter operator : +

Enter second number : 6

42.0

## 12. Read Identifier

import java.util.Scanner

public class project 12

public static void main (String [] args) {  
Scanner sc = new Scanner (System.in);

System.out.print ("Enter marks for OS : ");  
int os = sc.nextInt();

System.out.print ("Enter marks for DCN : ");  
int dcN = sc.nextInt();

System.out.print ("Enter marks for CO : ");  
int co = sc.nextInt();

System.out.print ("Enter marks for CE : ");  
int ce = sc.nextInt();

Date \_\_\_\_\_  
Page \_\_\_\_\_

```
System.out.println("Enter marks for oops");  
int oop = sc.nextInt();
```

```
double average = (os + den + co + ce + oop) / 5.0;
```

```
String grade = (average >= 80) ? "A"  
               : (average >= 70) ? "B"  
               : (average >= 60) ? "C"  
               : (average >= 50) ? "D"  
               : "F";
```

```
System.out.println("Average Marks: " + average);  
System.out.println("Grade: " + grade);
```

```
{  
}
```

Output:

Enter marks for OS: 67

Enter marks for DEN: 87

Enter marks for CO: 77

Enter marks for CE: 60

Enter marks for OOPS: 88

Average Marks: 75.8

Grade: B
